

FOCUS:

TACTICAL C3

The revolution in military communications is taking a new course. Emergent commercial innovations are driving new capabilities at the same time that the military is taking a new approach to networking in the field. This promises an explosion in new tactics, techniques and technologies. *SIGNAL's* August 2018 issue looks at the new direction Tactical C3 is going along with the technologies that will be needed to enable it.

- The new commanding general of the U.S. Army Cyber Command gives his take on the changing digital battlespace.
- Even as they field the Target Handoff System Version 2, the U.S. Marines are planning improvements—including possibly controlling a UAV.
- The Army's new Mission Command Network Modernization Implementation Plan lays out the blueprint for enabling future command and control.
- The commanding general of the Army's Communications–Electronics Command plots a digital future.
- Army network modernization could lead to a scalable network capable of being tailored for any of a number of missions.
- The Army's PEO C3T turns to iterative testing to get technology into soldiers' hands faster.
- Army planners are developing new C3 technologies to address the chaos of megacity urban warfare.

ADDITIONAL CONTENT:

- A U.S. Army specialist working as a hacker for the NSA describes the threat and the technologies that currently constitute cyber war.
- A premier command and control facility for the U.S Strategic Command receives a technological overhaul.
- Medical nanotechnologies embedded inside humans may be the next target of cybermarauders.
- DARPA's Advanced Radio Frequency Mapping Project (RadioMap), which will provide the ultimate in RF situational awareness, transitions to the Marine Corps.
